Credential Assessment

In a day where at least 60% of passwords used in companies do not satisfy minimum security requirements, the number one risk of any IT security architecture, no matter how thorough and extensive, remains the human factor. This includes the way users interact with the IT environment through the use of passwords.

Random sampling has shown that more than half of all passwords used in corporate environments do not satisfy even minimum-security requirements.

It is easy to define strong password policies, yet the key challenge is having the visibility to ensure that your users follow it correctly. Our Security Services team will conduct a Credential Assessment to help you understand your risks and weaknesses of your company's passwords. We will also provide clear indication of areas that require improvement before incidents happen.
