

Ranked Risk Assessment identifies and provides a risk rating on the exposures present within your systems and network.

Our Security Services team leverages best of breed tools configured to analyze your environment. Our assessment discovers, but is not limited to, the identification of system misconfigurations, missing patches, known exploits, out-of-date or unsupported software, and exposed services. The information provided from this assessment can then be leveraged to build remediation plans to fully eliminate the risks, or create a plan to reduce your risk exposure to an acceptable level.

Our Ranked Risk Assessment Report outlines the various discoveries and includes all related artifacts of the assessment. These findings are then categorized and ranked. We calculate your rankings based on Impact and Urgency to establish a risk-rating. The results include the vulnerability and its description, the affected asset, remediation techniques, and any additional references or informational sources that we believe you will find useful in analyzing the findings.
